Facebook Reviews App

Thank you for your detailed answer. The facebook app had permission for Canvas Platform but we removed it from our last submission, and we left only manage_pages permission by removing all the others.

This review application is a support platform for our website : www.bestintest.eu and for a person to use it this will have to be "installed" by a logged in user (logged in on bestintest.eu) and after that, as in the movie we attached, the application is linked to the account.

The canvas page is the page that will hold the information and it has an if/then/else clause that checks if the user is linked to our website, then the correct information from his account is shown else a default page that explains our services is shown and a registration button for creating a free account.

We submitted two applications that work the same and need the same permissions, one for reviews and one for testimonials, both built by the same developer's team and with the same permissions in mind. The one that is approved is here : https://developers.facebook.com/apps/852142644900919/review-status/ .

To sum things up : the facebook reviews app shows the reviews from bestintest.eu platform on a facebook tab page. To use it you have to login to bestintest.eu, "install" the app from publishing page on your facebook page or create an account from the static page that is shown.
